

In the Specification:

Please rewrite the paragraph beginning at Col. 2, line 29 to read as follows:

The receiving members 15 each are pivotally connected between the side wall 12 having the first apertures 13 and the separating board 11 at the two ends of a front side thereof and pivotally connected between the sliding plates 17, 17a at the two ends of a rear side thereof. In other words, the two ends of the front side of each [the] receiving member 15 each have a first stub 151 extending therefrom so as to be received in the first apertures 13, 13a of the side wall 12 and the separating board 11. The two ends of the rear side of each [the] receiving member 15 each have a second stub 152 extending therefrom so as to be received in the second apertures 18, 18a of the two sliding plates 17, 17a. The location of the pivotal connection of an end of a receiving member 15 to the side wall 12 is closer to the front side of the receiving member 15 than the rear side thereof, when taken along a first imaginary straight line passing through the pivotal connection of the receiving member to the side wall 12 and through the pivotal connection of the receiving member to the sliding plate 17. The first imaginary straight line is shown at 19 in FIG. 2.

Please re-write the paragraph beginning at Col. 2, line 41, to read as follows:

The actuating member 16 is pivotally connected between the two side walls 12 at two ends of a front side thereof and pivotally connected between the sliding plates 17 at the two ends of a rear side thereof. In other words, the two ends of the front side of the actuating member 16 each have a first shaft 161 extending therefrom so as to be received in lower holes 122 respectively defined through the two side walls 12. The two ends of the rear side of the

actuating member [15] 16 each have a second shaft 162 extending therefrom so as to be received in the second apertures 18 of the two sliding plates 17. The location of the pivotal connection of the end of actuating member 16 to the side wall 12 is closer to the front side of the actuating member than the rear side thereof, when taken along a second imaginary straight line passing through the pivotal connection of the actuating member to the side wall 12 and through the pivotal connection of the actuating member to the sliding plate 17. The second imaginary straight line is shown at 19a in FIG. 2. The receiving member 15 has a plurality of receiving recesses 153 defined therein so as to receive a tool such as a bit 14 therein and the actuating member 16 has a plurality of receiving portions defined therein so as to receive tools therein.

In the Drawings:

A proposed drawing amendment is attached. Please note this is the second drawing amendment, and the current amendments are presented in red.
